

# Real-Time Communication Network Architecture Design for Organizations with WebRTC

Pedro Vílchez

2015-07-13 Monday

# Why WebRTC?

1. It is Relatively new (2011); standardization process is not ended
2. It is a convergence between telecommunications and the Internet
3. There are already WebRTC applications in the market from telecommunication operators

Methodology

Contributions and  
Results

Conclusions and  
Future Work

- ▶ Previous project: start a simple community network<sup>1</sup>.
- ▶ Now: provide Real-Time Communications (RTC) to a community network such as Guifi.net.
  - ▶ Add value to the network
  - ▶ Enhance social cohesion within the community

---

<sup>1</sup>Starting, Contributing and Empowering Community Networks in cities

# Objectives

- ▶ Free and secure communication between users via an RTC system and community network infrastructure.
- ▶ Backward compatibility with VoIP<sup>2</sup> network. Hence, users can communicate to other VoIP operators from inside and/or outside Guifi.net.
- ▶ Designing RTC network architecture to fit the community network scenario.
- ▶ Ease of installation and usability of RTC.

---

<sup>2</sup>Voice over IP. The use of telephone adapted to the Internet network.

Conclusions and  
Future Work

- ▶ Communications
  - ▶ Protocol, signaling, gateway
  - ▶ Internet, flexible infrastructure for generic data.
    - ▶ Standardization: IETF
  - ▶ Traditional telephony, guaranteed delivery for real-time data.
    - ▶ Standardization: ITU
  - ▶ IETF and ITU did efforts to have networks which process real-time data and generic data
- ▶ Basic real-time quality parameters: bandwidth, mean delay, delay variation, etc.

# State of the art

- ▶ SIP signaling
  - ▶ Nature: establish, modify and terminate multimedia sessions in the Internet
  - ▶ Implemented XMPP-based solution (SIMPLE)
- ▶ XMPP signaling
  - ▶ Nature: manage instant messaging and presence of your contact list
  - ▶ Implemented SIP-based solution (Jingle)
- ▶ WebRTC
  - ▶ Open to any existing signaling method such as SIP or XMPP

# Network architecture analysis of Guifi.net

The selected scenario to design and implement an RTC system.

- ▶ Community: volunteers and professionals
- ▶ Government of Guifi.net: manage of Guifi.net's web, legal support
- ▶ Behavior, protocols and functionality: similar to Internet
- ▶ Network architecture: star topology and mesh
- ▶ Links: the vast majority of communication links are wireless
- ▶ Known services: Internet sharing and network control

# Network requirements

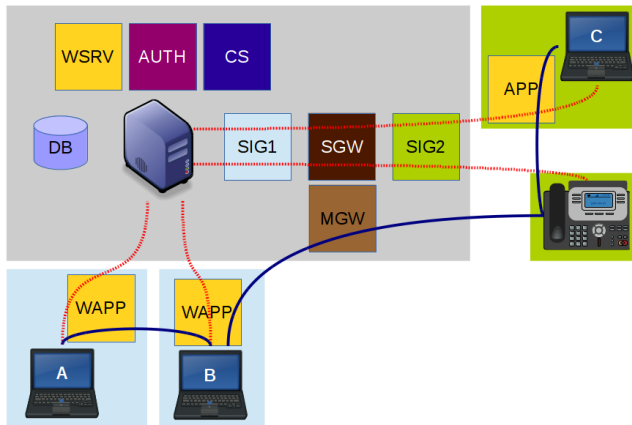

- ▶ QoS: differentiate real-time data from non real-time data
  - ▶ QoS on Guifi.net is complex
- ▶ G.114 says that delay should be below 150ms
  - ▶ Guifi.net seems to fit this requirement
- ▶ Bandwidth: Audio 64 Kbps, Video 1-10 Mbps
  - ▶ Guifi.net has common links from 15 to 150 Mbps

# Use cases

- ▶ Send calls: a user calls another user with an audio channel. Optional channels of communication if available: video and chat
- ▶ Receive calls: a user receives a call only if is connected to the service with at least one device and is available
- ▶ Integration: all the services are integrated and is the same account

Conclusions and  
Future Work

# Conclusions

- ▶ Objectives of the project are attainable
- ▶ WebRTC facilitates use of RTC in organizations of all sizes
- ▶ WebRTC requires some centralization
- ▶ Pending featured topics
  - ▶ Anonymity
  - ▶ WebRTC media cannot go to HTTP Proxy
  - ▶ Interoperability between WebRTC and SIP needs a media gateway

# Future Work

- ▶ Improve implemented use cases
- ▶ Implement remaining use cases
- ▶ Stress test of the demo
- ▶ Improve integration of XMPP and SIP signaling inside Guifi.net open source firmwares

# Thanks! Questions?
